

Air-Cooled Condenser for Refrigeration Systems

This air-cooled condenser is designed for refrigeration and ventilation applications. It dissipates heat generated during the refrigeration cycle within compressor systems, which ensures optimal performance and reliability.

Product Overview

High-Efficiency Thermal Management

This air-cooled condenser is engineered for high-performance heat dissipation in commercial refrigeration and ventilation systems. Utilizing a multi-row finned tube architecture, the unit maximizes heat exchange surface area to ensure optimal cooling cycle efficiency. Designed with a robust, durable frame, it provides reliable operation for industrial compressor systems requiring consistent performance under demanding conditions.

Technical Specifications

Construction Features

- Robust structural frame
- Electrical operation interface
- Multi-row tube configuration

Design Type	Air-cooled condenser
Heat Exchange Method	Multi-row finned tubes
Suitable Applications	Refrigeration Systems, Ventilation Systems, Compressor Systems
