

Automobile Engine Water Pump

This automobile engine water pump is engineered for efficient coolant circulation, maintaining optimal engine temperature. Its durable construction and precision-engineered impeller ensure reliable performance and efficient heat dissipation.

Product Overview

High-Efficiency Engine Cooling Solution

This automobile water pump serves as the primary power source for the engine's water circulation system. Engineered for durability and optimal performance, it features a robust cast aluminum housing and precision-machined surfaces to ensure seamless integration and reliable sealing. Designed to meet or exceed OEM standards, this unit promotes efficient heat dissipation to maintain optimal engine temperatures under varying operating conditions.

Technical Specifications

Key Components

- Precision-engineered impeller
- Sealed bearing assembly
- Multiple mounting points
- Internal flow channels

Part Identifier

7038

Material Construction

Durable cast aluminum and lightweight alloy

Performance & Application

Primary Function

Coolant Circulation, Engine Temperature Management, Heat Dissipation

Compatibility & Installation

Designed for easy installation with multiple ports and mounting points for seamless integration into existing engine cooling systems.
