

Automotive Engine Radiator

This automotive engine radiator cools the engine by dissipating heat from the coolant. It features aluminum fins and tubes for efficient heat transfer and includes connections for coolant hoses.

Product Overview

Automotive Engine Radiator

This automotive engine radiator is engineered to maintain optimal engine temperatures by effectively dissipating heat from the coolant. Featuring a high-efficiency core constructed with aluminum fins and tubes, it ensures reliable heat transfer under demanding operating conditions. Designed for direct fitment, this unit includes essential coolant hose connections and may incorporate integrated transmission oil cooler lines to support versatile vehicle configurations.

Technical Specifications

Compatibility Features

- Direct vehicle fitment
- Coolant hose inlet/outlet connections
- Integrated transmission oil cooler lines

Primary Function

Engine Cooling • Heat Dissipation

Core Material

Aluminum

Construction

Aluminum Fins, Aluminum Tubes, Plastic or Metal Tanks
