

Automotive Steering and Transmission Seal

This component is a seal used in automotive steering and transmission systems. It is designed to provide a tight seal while accommodating movement or vibration.

Product Overview

High-Performance Automotive Sealing Solution

This specialized steering and transmission seal is engineered to deliver a robust, leak-proof barrier within critical automotive assemblies. Featuring a multi-material construction of durable metal and flexible elastomer, it is designed to manage high-pressure environments while absorbing vibration. Its precision-grooved inner surface ensures seamless integration with rotating or reciprocating mechanical components.

Technical Specifications

Primary Applications

- Steering Systems
- Transmission Assemblies

Design Features

Multi-layered • Vibration Damping • Grooved Interface

Material Composition

Metal, Rubber, Composite
