

Blind Rivets

Blind rivets join materials where only one side is accessible. During installation, a mandrel expands the rivet body, clamping materials together before snapping off, providing a secure and efficient fastening solution.

Product Overview

Versatile Fastening Solution

Blind rivets, often referred to as pop rivets, are essential fasteners designed for joining materials when only one side of the workpiece is accessible. They operate by pulling a setting mandrel through the rivet body, which expands the body to clamp materials securely before the mandrel snaps off. These fasteners are widely used across industries such as construction, automotive, and electronics, offering a fast, reliable, and cost-effective assembly method.

Technical Details

Fastener Type

Blind Rivet • Pop Rivet

Material Composition

Aluminum, Steel, Stainless Steel

Applications

Common Industries

- Construction
- Automotive
- Electronics
