

Carburetor for Internal Combustion Engines

This carburetor mixes air and fuel for internal combustion engines. It provides the correct air-fuel mixture for efficient combustion with its float chamber, jets, and throttle valve.

Product Overview

High-Performance Carburetor

This carburetor is a precision-engineered device designed to mix air and fuel for internal combustion engines, ensuring optimal performance and fuel economy. It features a robust design including a float chamber, integrated jets, and a responsive throttle valve to regulate fuel flow and air intake. Ideal for maintaining or restoring older engines, this component is essential for achieving the correct air-fuel mixture required for efficient combustion.

Technical Specifications

Key Components

- Float chamber
- Fuel jets
- Throttle valve

Primary Function

Air-fuel mixture regulation for internal combustion engines

Performance

Key Benefits

Optimal Performance, Fuel Economy, Efficient Combustion
