

Central Air Conditioning System for Zoned Temperature Control

This central air conditioning system is designed for refrigeration and ventilation applications. It features a main unit connected to multiple smaller distribution units for zoned temperature control.

System Overview

High-Efficiency Zoned Climate Control

This central air conditioning system is engineered for professional refrigeration and ventilation applications requiring precise temperature management. Featuring a robust main unit linked to multiple compact distribution units, it enables efficient zoned temperature control across diverse commercial or industrial environments. Its versatile design facilitates seamless integration into existing infrastructure where reliable performance and localized cooling are essential.
