

Ejector Water Pump

This ejector pump uses a fluid jet to create suction. It is commonly applied to pump water from sources where the water level sits below the pump.

Product Overview

Deep Well Jet Pump System

The AUTOJETDP series deep well jet pump is a highly reliable surface pump solution consisting of two pumps connected in series: an ejector pump and a centrifugal pump. Designed for deep well applications, the ejector is lowered into the well while the centrifugal unit remains on the surface, connected by two pipes. This system is ideal for pumping clean water and non-aggressive fluids, making it an economical and convenient choice for domestic water transfer and pressure boosting.

Technical Specifications

Pump Type	Deep well jet pump (two-stage series)
Fluid Compatibility	Clean water, Non-aggressive chemical fluids

Installation & Usage

Installation Requirements

- Install in a covered area protected against weather
- Install a foot valve with a filter on the suction end for adequate counter-pressure

System Components

System Components

Tank • Pressure gauge • Pressure switch • Foot valve

Key Design Merit	Integrated tank-auto system for enhanced convenience
