

Engine Bearing Set

Engine bearing sets provide support for crankshafts within an engine. The bearings are made from metallic material with a coated surface to reduce friction and wear.

Product Overview

Engine Bearing Set Overview

This comprehensive engine bearing set is engineered to provide reliable performance and durability for internal combustion engines. Designed with high-quality materials and a precision-coated surface, these bearings are optimized to minimize friction and reduce wear during critical engine operation. This set includes a variety of bearing sizes suitable for both connecting rod and main crankshaft journal applications, ensuring a complete solution for engine maintenance and repair.

Technical Specifications

Condition

New • Protective Packaging

Application

Automotive Engine

Component Type

Connecting Rod Bearings, Main Crankshaft Bearings

Surface Treatment

Low-friction coating
