

Engine Cooling Radiator

This car engine radiator is designed for cooling internal combustion engines. Coolant circulates through the core, transferring heat to the fins, which are then cooled by airflow.

Product Overview

Engine Cooling Radiator

This high-performance engine cooling radiator is engineered to maintain optimal operating temperatures for internal combustion engines. Featuring a robust core construction with multiple tubes and fins, it maximizes surface area for efficient heat dissipation. The unit is designed for durability and reliability, ensuring consistent coolant circulation and effective thermal management under various driving conditions.

Technical Specifications

Core Components

- Coolant tubes
- Heat dissipation fins
- Inlet connection
- Outlet connection
- Pressure cap

Materials

Aluminum, Plastic

Performance Features

Cooling Mechanism

100 %

Surface Area Efficiency
