

Evacuated Tube Solar Water Heater

This high-efficiency solar water heater uses an evacuated tube collector to absorb solar energy. It includes a cylindrical water storage tank mounted above vacuum tubes, all supported by a durable frame.

Overview

High-Efficiency Solar Heating

This evacuated tube solar water heater is designed for optimal solar energy absorption, providing a sustainable and cost-effective solution for residential and commercial hot water needs. The system features a durable frame supporting an array of vacuum tubes connected to a cylindrical water storage tank. It is an ideal choice for those looking to reduce energy costs while maintaining reliable hot water supply.

Technical Specifications

Collector Technology	Evacuated Tube
System Configuration	Cylindrical storage tank with vacuum tube array

Applications

Suitable Environments	Residential, Commercial
