

Facial Recognition System for Computers

This system integrates facial recognition with computer operation. It employs a camera and software to identify individuals for security or access control.

Product Overview

Advanced Facial Recognition Security

This facial recognition system is designed for dynamic, high-accuracy identity verification, even in complex environments. By utilizing a miniature camera to capture and compare portraits against a secure database, the system automates secure computer login procedures. It offers a streamlined security solution for managing operator access and protecting sensitive data.

Technical Capabilities

Technology Type	Dynamic Face Recognition
Environmental Capability	Complex background recognition

Functionality

Core Function	Automated Computer Login
Key Features	Dynamic Recognition, Database Comparison, Secure Access, Automated Authentication

Hardware

Hardware Interface	Integrated miniature camera
