

# Filling Loop Assembly with Check and Isolation Valves

This filling loop assembly connects a central heating system to the mains water supply for easy filling. It provides a temporary connection to pressurize the heating system and incorporates backflow prevention.

## Product Overview

### Professional Filling Loop Assembly

This filling loop assembly is designed for the reliable connection of central heating systems to the mains water supply. It facilitates easy system filling and pressure maintenance while incorporating essential backflow prevention to safeguard the water supply. Built with high-quality brass valves and durable copper piping, this assembly provides a robust solution for heating system pressurization.

## Technical Specifications

### Key Features

- Integrated check valves for backflow prevention
- Isolation valves with manual handles
- Connection points with caps and O-rings
- Designed for temporary connection and pressurization

### Primary Application

Central Heating Systems • Mains Water Connection

### Materials

Brass, Copper
