

Flue Gas Operated Lithium Bromide Absorption Chiller

This flue gas operated lithium bromide absorption chiller is designed for industrial applications requiring efficient cooling solutions. It utilizes waste heat from flue gas to drive the absorption cycle, reducing energy consumption and minimizing environmental impact.

Overview

Industrial Cooling Efficiency

This lithium bromide absorption chiller is engineered for industrial applications that demand high-efficiency cooling solutions. By utilizing waste heat from flue gas to drive the absorption cycle, the system significantly reduces energy consumption and minimizes environmental impact. It features advanced heat exchanger technology and robust construction, ensuring reliable performance and seamless integration into existing industrial processes.

Technical Specifications

Cooling Technology	Lithium Bromide Absorption
Energy Source	Waste Flue Gas

Key Components

Core Components

- Absorber
- Generator
- Condenser
- Evaporator

Maintenance and Operation

Operational Features	Easy Maintenance, Accessible Components, Comprehensive Monitoring
----------------------	---
