

Forged Flanges for Piping Systems

Forged flanges are crucial components in piping systems, connecting pipes, valves, pumps, and other equipment. They are typically made of high-strength materials like carbon steel or stainless steel to withstand high pressure and temperature conditions.

Product Overview

Industrial Grade Forged Flanges

These forged flanges are essential components designed for connecting pipes, valves, pumps, and other equipment to create secure, high-performance pipeline systems. Manufactured to meet stringent industry standards, they offer exceptional dimensional accuracy and structural integrity suitable for high-pressure and high-temperature environments. Their robust construction makes them ideal for critical applications across sectors like oil and gas, chemical processing, power generation, and water treatment.

Technical Specifications

Surface Finish Options

Anti-rust coating • Galvanization

Available Materials

Carbon Steel, Stainless Steel, Alloy Steel

Application Areas

Suitable Industries

- Construction Machinery
- Petroleum Machinery
- Agricultural Machinery
- Wind Power Equipment
- Chemical Equipment
- Pressure Vessels
- Nuclear Electricity
- New Energy
- Metallurgy

Design Features

Key Design Attributes

Feature	Benefit
Precision-drilled bolt holes	Easy installation and secure fastening
Raised face design	Ensures a secure and reliable seal
Forged construction	High durability and structural integrity
