

Four-Cylinder Diesel Engine for Power Transmission

This robust diesel engine is designed for applications within the electric power transmission and distribution sector. Its four-cylinder configuration enhances power output and efficiency.

Overview

Robust Power Solution

The Y485G is a high-performance four-cylinder diesel engine specifically engineered for the demands of the electric power transmission and distribution sector. Its robust construction ensures consistent reliability and efficiency in challenging industrial environments. Equipped with an advanced fuel injection system and an integrated cooling fan, it maintains optimal operation under heavy load conditions.

Technical Specifications

Engine Configuration	Four-cylinder
Cooling Method	Forced air cooling via integrated fan
Application Compatibility	Electric Power Transmission, Distribution, Industrial

Key Components

Core Components

- Fuel Injection System
- Oil Filtration System
- Engine Cooling Fan
