

High Frequency Hydraulic Vibration Hammer

The High Frequency Hydraulic Vibration Hammer is designed for driving piles into the ground or extracting them. It utilizes high-frequency vibrations generated by a hydraulic system for efficient operation in various soil conditions.

Product Overview

High Frequency Hydraulic Vibration Hammer

The High Frequency Hydraulic Vibration Hammer is a robust and efficient solution designed for pile driving and extraction in demanding construction environments. Utilizing a powerful hydraulic system, it delivers adjustable frequency and amplitude settings to ensure optimal performance across diverse soil conditions. This versatile equipment is engineered for durability and seamless integration with existing crane or excavator systems, making it an ideal choice for foundation, bridge building, and large-scale civil engineering projects.

Performance & Technical

Suitable Applications

- Foundation construction
- Bridge building
- Civil engineering
- Infrastructure development
- Pile extraction

Mounting Options

Crane, Excavator

Design & Reliability

Key Features

Hydraulic Power Unit • Adjustable Frequency • Adjustable Amplitude • Durable Construction

Adjustable Settings

Yes
