

Hydroelectric Power Generation Plant

This hydroelectric plant harnesses water resources to generate electricity. The project integrates civil engineering and power generation technologies.

Project Overview

Hydroelectric Power Generation Plant Overview

This hydroelectric power generation plant is a significant infrastructure project designed to harness water resources for efficient electricity generation. Featuring a substantial dam structure and a large reservoir capacity, the facility is engineered to operate effectively within challenging mountainous terrain. Since its commissioning in September 2006, the plant has served as a reliable source of power generation.

Technical Specifications

Installed Capacity

120 MW

Installed Capacity

Dam Height

88 m

Reservoir Capacity

247 million m³

Project History

Commissioning Date

September 2006
