

Industrial Material Cooling System with Conveyor

This cooling system uses a frequency converter to calculate position, allowing for rapid and precise braking. It incorporates cylinder lifting for panel charge and a mechanical cam unit for panel discharge.

Overview

Industrial Material Cooling System

This industrial cooling system is engineered for high-volume manufacturing environments, featuring a robust conveyor belt for automated material handling. Designed with parallel cooling racks, it maximizes space utilization and ensures consistent, reliable cooling performance for continuous processing. Ideal for large-scale operations requiring efficient thermal management.

Technical Specifications

System Type	Industrial Material Cooling System
Handling Mechanism	Automated Conveyor Belt
Cooling Design	Parallel Racks, Continuous Processing, High-Volume Operation

Key Features

Performance Highlights

1 High Cooling Efficiency	1 High Automation Level
