

Industrial Water Purification System

This industrial water purification system is designed for high-volume water treatment applications. It removes impurities and contaminants through pre-filtration, activated carbon filtration, and reverse osmosis stages to produce clean, potable water.

System Overview

High-Volume Industrial Water Treatment

This industrial-grade water purification system is engineered for high-volume applications requiring reliable, consistent output. Featuring a multi-stage filtration design, it integrates pre-filtration, activated carbon, and reverse osmosis processes to effectively remove impurities and contaminants. The robust stainless steel construction and intuitive control panel make it an ideal solution for commercial and industrial settings demanding high-quality, potable water.

System Configuration

Filtration Stages

- Pre-filtration stage
- Activated carbon filtration
- Reverse osmosis (RO)

Build Material	Stainless steel
Key Features	Stainless Steel Tanks, RO Technology, Multi-Stage Filtration, Control Interface
