

LCD Display System with Remote Management

This LCD display system allows networked control of remote display units and indicator lights. It uses a master controller and 485 communication protocol for efficient management.

System Overview

Integrated Remote Management System

This advanced LCD display system is engineered for comprehensive remote management and monitoring. It features a centralized processing unit that orchestrates communication with peripheral devices, including remote display units and indicator lights. Utilizing a robust 485 communication protocol, the system ensures reliable data transmission and control across the network.

Technical Architecture

System Components

- Central Processing Unit
- Master Controller
- Remote Display Units
- Indicator Light Controller
- Printer

Communication Protocol	RS-485
Connectivity	Networked, Serial Port, Bus Driver

System Performance

Remote Management Features

Telemetry Display • Telemetry Driver • Indicator Light Management
