

Marine Condensate Water Hot Well Unit

This marine hot well unit is designed for steam condensate and boiler water supply systems on ships and drilling platforms. As essential equipment for closed-loop circulatory systems, the unit features a compact structure and is easy to operate.

System Overview

Marine Condensate Water Hot Well Unit

The marine hot well unit serves as an essential component for steam condensate water closed-loop circulatory systems on ships and drilling platforms. This compact, integrated unit efficiently recovers condensate, filters out impurities and oil, and returns water to the boiler for recycling. Its design optimizes space while providing a robust solution for fresh water conservation and thermal energy management.

Applications

Marine Vessels, Drilling Platforms, Boiler Feed Systems, Condensate Recovery

System Components

Integrated Components

- Marine atmosphere condenser
- Condensate water observation cabinet
- Hot water well
- Automatic replenish-water valve
- Thermometer and temperature controller
- Liquid level controller
- Hot water pump
- Electric control panel

Design Features

Key Operational Benefits

- Compact structure for space-efficient installation
- Automated water replenishment control
- Efficient filtration of oil and impurities
- Optimized for closed-loop heat exchange
- Customizable exterior piping interfaces
