

# Network Interface Termination Device

This network interface termination device is designed for data transmission and network connectivity. It serves as a termination point or interface within a network infrastructure.

## Overview

### Network Interface Termination Device

The EHA-1061 is a compact network communication device engineered for reliable data transmission and network connectivity. Designed to serve as a critical termination point within network infrastructure, it ensures stable and efficient data flow. The unit features integrated visual status indicators and a ventilated enclosure to maintain optimal thermal performance in diverse operating environments.

## Technical Specifications

Model Number	EHA-1061
Device Type	Single-port Network Termination Device

## Features & Indicators

Status Indicators	Power, Ethernet Link, Activity
-------------------	--------------------------------

## Design & Build

Thermal Management	Yes
Form Factor	Compact Enclosure
