

Network Signal Splitter and Distributor

This network communication device is designed for efficient signal splitting and distribution. It features multiple ports for connecting various network components and is housed in a durable metal enclosure.

Product Overview

High-Performance Signal Management

This network communication device is engineered for efficient signal splitting and distribution across complex network infrastructures. Housed in a durable metal enclosure, it ensures optimal heat dissipation and robust protection for sensitive internal components. It provides a reliable solution for professional environments requiring stable and consistent signal management across multiple connections.

Technical Specifications

Application Suitability

Network Infrastructure • Signal Management

Enclosure Material	Durable Metal
Primary Function	Signal Splitting, Signal Distribution
