

Nuclear Power Plant Construction

This infrastructure facilitates the generation of electricity through nuclear fission. Large, cylindrical reactor buildings are constructed with the aid of cranes and complex structural frameworks.

Project Overview

Nuclear Infrastructure Development

This service encompasses the end-to-end construction of large-scale nuclear power plant facilities. The project scope includes the erection of reactor containment structures, structural framework installation, and site development. Designed for high-capacity energy generation, these projects utilize advanced engineering techniques to meet rigorous safety and operational standards.

Site Characteristics

Coastal Location, Large-Scale Infrastructure, Reactor Containment

Construction Details

Key Construction Components

- Cylindrical reactor buildings
- Structural steel frameworks
- Heavy-duty scaffolding systems
- Site-wide crane operations
