

Precision Transmission Gear

This precision-engineered transmission gear is designed for robust performance and durability. The component features intricate grooves and mounting features, ensuring secure and precise integration within a transmission system.

Product Overview

Precision-Engineered Transmission Component

This transmission gear is designed for robust performance and high durability in demanding industrial applications. Featuring a multi-tiered circular structure with a central hub containing four symmetrically arranged cylindrical bores, the component ensures reliable power transfer and smooth operation. The machined metallic finish and intricate outer grooves are engineered for secure and precise integration within complex transmission systems.

Physical Design

Mounting Configuration

- Central hub
- Four symmetrical cylindrical bores
- Intricate outer perimeter grooves

Structure Type

Multi-tiered circular structure

Technical Features

Manufacturing Finish

Machined Metallic • High-Precision

Primary Use

Power Transmission, Industrial Machinery, Transmission Systems
