

# Reciprocating Beam Pumping Unit for Oil Extraction

This unit extracts crude oil from onshore wells. Its reciprocating motion, driven by a motor and gearbox, powers a downhole pump.

## Product Overview

### Efficient Onshore Oil Extraction

This reciprocating beam pumping unit, commonly known as a pumpjack, is a critical component for lifting crude oil from onshore wells. It utilizes a robust motor and gearbox system to drive a downhole pump, ensuring consistent production in fields where natural pressure is insufficient. Designed for durability, the heavy-duty steel structure is engineered to withstand the most demanding operational conditions found in global oil fields.

## Technical Mechanism

### Drive System

- Motor driven
- Gearbox transmission

### Motion Type

Reciprocating

## Application

### Primary Application

Onshore Extraction • Crude Oil Lifting • Artificial Lift

## Construction

### Structural Material

Robust Steel

## Operational Context

### Operational Environment

Demanding oil field conditions
