

Ringlock Scaffolding Standard

The ringlock standard is a vertical support component in a ringlock scaffolding system. Rosettes at regular intervals allow connections of ledgers, braces, and other components at various angles, providing flexibility and stability.

Product Overview

Professional Scaffolding Standard

The ringlock standard serves as the primary vertical support component in high-performance scaffolding systems. Designed with integrated rosettes at regular intervals, it allows for secure, multi-directional connections of ledgers and braces at various angles. Engineered for maximum stability and vertical load capacity, this component is essential for safe construction and maintenance operations in demanding environments.

Technical Specifications

Surface Treatment	Galvanized, Corrosion Resistant
Material	High-strength steel
Primary Function	Vertical load-bearing support

System Compatibility

Key Features

- Multi-directional connection capability
- High structural stability
- Available in various lengths

Connection Interface	Rosette system
