

# Ringlock Scaffolding Vertical Standard

Ringlock scaffolding vertical standards are essential components for modular scaffolding systems. These vertical members provide robust support and connection points for ledgers and braces with rosette connectors at regular intervals.

## Product Overview

### High-Strength Ringlock Standard

The ringlock standard serves as the primary vertical load-bearing component for professional scaffolding systems. Constructed from high-strength steel, these units are designed to ensure maximum durability and safety on construction sites. The integrated rosette connectors allow for versatile, multi-directional connections with ledgers and braces, facilitating rapid assembly and highly adaptable configurations.

## Technical Specifications

### Primary Applications

- Vertical support
- Scaffolding structural framework
- Load-bearing assemblies

Material	High-strength steel
Surface Finish	Galvanized
Connectivity	Multi-directional, Rosette connectors
