

Roller Bearing

This roller bearing is designed to minimize friction in moving parts of machinery. Its cylindrical rollers are built to withstand heavy radial loads.

Product Overview

High-Performance Roller Bearing

This roller bearing is engineered for demanding industrial applications requiring reliable rotational support. Designed with cylindrical rollers, it excels at handling heavy radial loads while minimizing friction between moving parts. Constructed from high-strength steel alloys, this component ensures durability and smooth operation in heavy machinery and automotive environments.

Technical Details

Primary Load Capacity

Radial Load

Bearing Type	Roller Bearing
Material	High-strength steel alloy
Typical Applications	Heavy Machinery, Automotive, Industrial Equipment
