

Rotary Hydraulic Metal Processing Machine

This rotary hydraulic machine is designed for metallic processing. It features a circular array of hydraulic actuators connected to a central control system, enabling efficient and automated processing of metallic components.

Overview

Rotary Hydraulic Metal Processing Machine

This advanced rotary hydraulic machine is engineered specifically for efficient metallic component processing. It utilizes a circular array of high-precision hydraulic actuators connected to a centralized control system to ensure consistent performance. The included dedicated control panel, housed in a robust green cabinet, provides operators with intuitive command over the automated processing cycles.

Technical Specifications

Machine Type	Rotary Hydraulic
Primary Application	Metallic Processing

System Components

Control System

- Centralized control system
- Dedicated control panel cabinet
- Multiple operation buttons
- Indicator status lights

Control Cabinet Color

Green

Actuator Design	Circular array
