

Satellite TV LNB Downconverter

The low-noise block downconverter (LNB) is a receiving device mounted on satellite dishes used for satellite TV reception. It amplifies weak signals, filters out noise, and downconverts the signal to a lower intermediate frequency for transmission to the receiver.

Product Overview

Satellite Signal Reception Technology

This low-noise block downconverter (LNB) serves as the critical receiving interface mounted on satellite dishes for high-quality TV signal reception. It expertly amplifies weak satellite signals while filtering out unwanted noise to ensure signal clarity. By downconverting signals to a lower intermediate frequency range, it enables efficient transmission over standard coaxial cables with minimal loss. Housed in a durable, weatherproof enclosure, it is designed for long-term reliable performance in outdoor environments.

Technical Specifications

Primary Function	Signal amplification, noise filtering, and frequency downconversion
Mounting Location	Satellite dish feed horn
Build Quality	Weatherproof Enclosure, Outdoor Rated, Signal Shielding
Signal Transmission	Standard Coaxial Cable
