

Stainless Steel Submersible Water Pump

This submersible pump is made from stainless steel for corrosion resistance and long-term durability. It is designed for water extraction in applications such as irrigation, water supply, and pressure boosting.

Overview

High-Performance Submersible Pump

The 4SD8 series stainless steel submersible pump is engineered for efficient water extraction from wells and boreholes. Constructed with durable stainless steel, it offers exceptional corrosion resistance and longevity in demanding environments. This versatile unit features a multi-stage impeller system for high-pressure output and includes a built-in check valve to prevent backflow and water hammer damage.

Technical Specifications

Key Features

- Multi-stage impeller system
- Built-in check valve
- Corrosion-resistant design
- Quiet operation

Construction Material	Stainless Steel
Pump Type	Submersible

Applications

Suitable Applications	Irrigation, Water Supply, Pressure Boosting
-----------------------	---
