

Stainless Steel Submersible Water Pump

This submersible pump is constructed from stainless steel, offering corrosion resistance and durability. Its multi-stage design provides high pressure and flow rates, with a built-in check valve to prevent backflow.

Overview

High-Efficiency Submersible Solution

The 4SP3 series stainless steel submersible pump is engineered for efficient water extraction from wells and boreholes. Constructed from durable stainless steel, this unit offers exceptional corrosion resistance and longevity in demanding environments. Its multi-stage design delivers high pressure and consistent flow rates, making it an ideal choice for irrigation, municipal water supply, and dewatering applications.

Technical Specifications

Series	4SP3
Construction Material	Stainless Steel
Key Features	Multi-stage design, Built-in check valve, Compact design, Corrosion resistant

Applications

Suitable Applications

- Irrigation
- Water supply
- Dewatering
- Well and borehole extraction
