

Three-Tier System Architecture Software

This software supports a three-tier system architecture. It facilitates interconnected operations between company, transportation department, and station levels.

System Overview

Scalable Three-Tier Infrastructure

This advanced three-tier system architecture is engineered to provide seamless integration across logistics and transportation networks. By connecting company-level servers, transportation departments, and individual stations, the software ensures robust data flow and centralized management. It supports complex operations including logistics servers, backup systems, and diverse transport subsystems to enhance operational efficiency.

Network Topology

Three-Tier Architecture • Interconnected Network • Centralized Backup

System Hierarchy

Hierarchy Levels

- Company Level
- Transportation Department Level
- Station Level

Components Overview

| Level | Key Components |
|---------------------|----------------------------------|
| Company Level | Logistics Server, Backup Systems |
| Transportation Dept | Car/Ship/Rail Subsystems |
| Station Level | Station Subsystem |

Integration Capabilities

Supported Subsystems

Logistics Server, Car Transport Subsystem, Ship Transport Subsystem, Rail Transport Subsystem, Fast Transport Subsystem
