

# Variable Frequency Constant Pressure Water Supply System

This system uses variable frequency drive technology to maintain constant water pressure. Multiple vertical multistage pumps are connected in parallel on a common base with stainless steel manifolds, along with a control panel for automated operation and pressure regulation.

## Overview

### Variable Frequency Constant Pressure Water Supply System

This advanced water supply system utilizes variable frequency drive technology to ensure consistent water pressure delivery across varying demand levels. Featuring multiple vertical multistage pumps connected in parallel, the unit is mounted on a robust common base with stainless steel manifolds. It is designed for automated operation, making it an efficient solution for maintaining stable pressure in complex water distribution networks.

## Technical Specifications

### Construction Materials

- Stainless steel manifolds
- Common base mounting

### Control Features

Automated Operation • Pressure Regulation

### System Configuration

Parallel Pump Setup, Vertical Multistage, Variable Frequency Drive

## Performance Metrics

### Key Performance Indicators

**1 High**

Pressure Consistency

**2 Automated**

Operation Mode
