

Variable Refrigerant Flow Cooling System

This variable refrigerant flow (VRF) cooling system is designed for commercial and residential applications. It provides efficient cooling with precise temperature control and features a modular design for flexible installation.

Overview

High-Efficiency Cooling Solution

This Variable Refrigerant Flow (VRF) cooling system is designed specifically for cooling-only applications in environments where ambient temperatures consistently remain above 20°C. Engineered for both commercial and residential settings, the unit offers precise temperature control and energy-efficient performance. Its modular design supports parallel installation of multiple outdoor units, providing flexible capacity adjustment to meet diverse building requirements.

Technical Specifications

System Type	Cooling-only VRF (Variable Refrigerant Flow)
Recommended Ambient Temperature	> 20°C
Installation Capability	Yes
Key Installation Features	Modular Design, Parallel Outdoor Unit Support, Scalable Capacity

Performance Metrics

Performance Highlights

20 °C

Minimum Ambient Operating Temperature
