

Water Turbine Generator for Hydroelectric Plants

This large-scale water turbine generator is designed for use in hydroelectric power plants. It features a cylindrical housing with a green finish, stainless steel railings, and a ladder for access.

Overview

High-Efficiency Hydroelectric Power Generation

This large-scale water turbine generator is engineered specifically for robust performance in hydroelectric power plant environments. Featuring a durable cylindrical housing with a protective green finish, the unit is designed for long-term reliability and ease of maintenance. It includes integrated safety features such as stainless steel railings and access ladders, along with a top-mounted control unit for streamlined operation.

Technical Specifications

Key Components

- Cylindrical housing
- Top-mounted control unit
- Integrated ventilation grilles
- Stainless steel access railings
- Maintenance ladder
